

Industrial Hygienist, Safety Managers and Plant Engineers have contracted with eNoise Control to perform noise mapping for their plant.

Sound mapping can provide our clients with a visual representation of the sound levels that workers are being exposed to on the work floor. This map then can be used as a baseline of current noise levels in the plant. This baseline can be the starting point to help address high noise level areas, time weighted averages and potential noise control engineering.

By hiring an acoustic consultant, such as eNoise Control, your factory can better identify noise levels, source noise, and sound abatement techniques to help lower these levels. Our acoustical consulting services helps take out the "guess work" in addressing sound problems.
